1. The first part of the paper is devoted to a discussion of the  
theoretical aspects of the problem. It is shown that the  
problem is equivalent to a problem in the theory of  
differential equations. The main result of this part is  
the theorem that the problem has a unique solution  
if the initial conditions are satisfied. The proof of this  
theorem is given in the next section.

2. In the second part of the paper, the problem is solved  
for a particular case. It is shown that the solution  
is given by the following formula:

$$y = \frac{1}{2} \left( e^{x} + e^{-x} \right) \cos x$$

where  $x$  is the independent variable. This formula  
satisfies the initial conditions and the differential  
equation. It is therefore the unique solution of the  
problem for this particular case.

3. In the third part of the paper, the problem is solved  
for a general case. It is shown that the solution  
is given by the following formula:

$$y = \frac{1}{2} \left( e^{x} + e^{-x} \right) \cos x + \frac{1}{2} \left( e^{x} - e^{-x} \right) \sin x$$

where  $x$  is the independent variable. This formula  
satisfies the initial conditions and the differential  
equation. It is therefore the unique solution of the  
problem for this general case.
